SOP ICT-001 — ICT Inventory Management

Document version :	1.00
Implementation date :	30 Sep.2016
Document ref. :	SOP_ICT-001_ICT-Inventory_Management_v1.00_dd.26_Aug.2016

I. PURPOSE

This Standard Operating Procedure (SOP) describes how ICT hardware, software, network appliances and other ICT-related material is purchased, inventoried and decommissioned in Quipment.

II. SCOPE

This SOP is applicable to all purchased, inventoried and decommissioned ICT material in Quipment SAS and in Quipment INC.

III. RESPONSIBILITIES

The responsibilities, mentioned in *italics*, are defined in the Functional Matrix as a role. The Functional Matrix indicates which persons are entitled to take on this responsibility.

IV. DEFINITIONS

All terms and abbreviations, used in this document, that may need clarification, are explained in a central document: "Quipment's Glossary of Terms and Abbreviations".

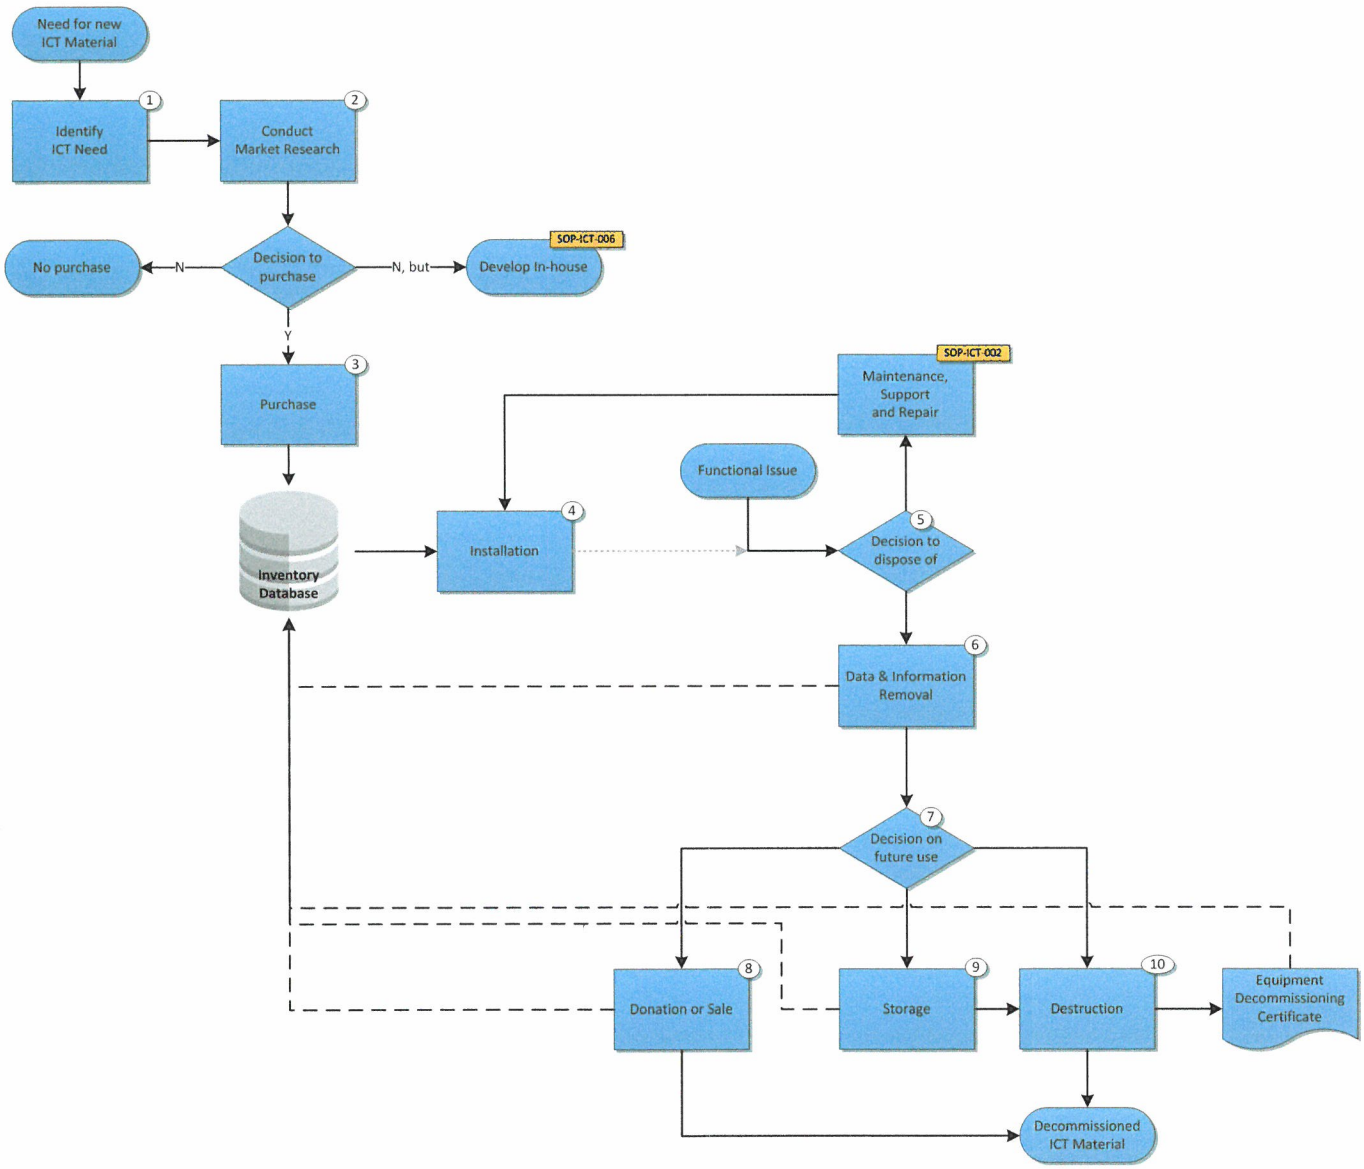
SOP ICT-001

ICT Inventory Management

Document version : 1.00
Implementation date : 30 Sep.2016
Document ref. : SOP_ICT-001_ICT-Inventory_Management_v1.00_dd.26_Aug.2016

V. FLOWCHART



VI. PROCEDURE

1. Identify ICT Need

- Whenever a need for ICT material is expressed by a collaborator, he/she addresses the request informality to his/her supervisor. Such material may consist of hardware, software, network appliances or any other ICT-related material.
- If the supervisor agrees with further pursued, the requester addresses his/her request to *ICT Management.*

2. Conduct Market Research

- *ICT Management* conducts a market research, adapted to the importance of the request and the probable cost of the requested material.
- *ICT Management* identifies:
  - what kind of material is available on the market,
  - what material would best fit in the current ICT strategy and infrastructure, and
  - the cost of purchase of such material.
- *ICT Management* presents the request with the collected information, including cost and proposed material to be purchased, to *General Management* who decides:
  - not to purchase at all. In this case the requester in informed of the decision.
  - allow the purchase of the requested equipment, in this case go to step 3, or
  - not to purchase but develop the ICT application in-house, in this case go SOP-ICT-006.

  There may be cases when it may be decided that material is purchased but needs configuration or adaptation in-house. In such case a combination of step 3 of this SOP and SOP-ICT-006 is needed. SOP-ICT-006 is in such case mainly applicable to the configuration or adaptation that must be done in-house.

3. Purchase

- If *General Management* has decided in favor of the purchase of ICT material, *ICT Management* is in charge of ordering the purchase in collaboration with *Administrative Management* according to SOP-PS-001.
- Once a purchase order has been sent out, *ICT Management* updates the Inventory database with the data of the ICT material ordered, indicating that this material is in a status of ordering. Common sense is used to define the level of detail that goes into the Inventory Database, e.g. a power cable is considered to be part of an ICT hardware and is not uniquely identified; *ICT Management* decides on the relevancy of the level of detail.
- All licenses for software that is not open source or not officially free, are captured in the Inventory Database.
- After delivery, *ICT Management* updates the information in the Inventory Database and changes the status to the one of delivered material.

4. Installation

- *ICT Management* organizes the installation of the purchased ICT material and ensures that:
  - the material functions correctly,
  - meets the user's expectations, and
  - complies with Quipment's ICT policies and strategies.
- If needed, *ICT Management* ensures that the user(s) receive the appropriate training and manuals for the use of the new ICT material.
- After installation and relevant changes or upgrades to the ICT material, *ICT Management* updates the Inventory Database with the appropriate information.

5. Decision to dispose of

- Whenever ICT material either becomes obsolete or has functional difficulties, any collaborator can address this to *ICT Management* who investigates the issue.
- If the issue can be solved by a technical intervention, repairing or upgrading, *ICT Management* can decide to this effect and SOP-002 applies.
- If the *ICT Management* considers that the ICT material is not worth any type of intervention anymore, *ICT Management* will propose to *General Management* to dispose of the ICT material.
- *ICT Management* ensures that the information in the *Inventory Database* is updated accordingly.

6. Data & Information Removal

- Before any ICT material is disposed of, *ICT Management* ensures that any type of data, files or other relevant information is collected from the ICT material and all remaining data, files and other relevant information is removed from the ICT material. The removal is executed in such a way that no retrieval of data, files and other relevant information from the ICT material can be conducted anymore.
- *ICT Management* ensures that the information in the *Inventory Database* is updated accordingly.

7. Decision on future use

- After data and information have been removed from the ICT material, *ICT Management* may propose the best future use to *General Management*. This can be:
  - Donation or Sale (see step 8),
  - Storage for defined time period (see step 9),
  - Destruction (see step 10),

8. Donation or Sale

- Whenever ICT material is donated or sold to third parties, *Administrative Management* decides on the appropriate receiver, price and conditions. In no instances Quipment provides any type of warranty on the ICT material provided.

- *ICT Management* ensures that the information in the *Inventory Database* is updated accordingly.

9. Storage

- For legal purposes some ICT material may need to be stored for a period of time before destruction.
  - This mainly applies to media that can carry information and data, such as hard drives that are stored for 15 years before destruction.
  - Also outdated software may need to be stored for some time before disposal in order to ensure that old data or old files could be opened and read by that software. Software must be stored for 25 years or as long as the applicable data need to be archived, whatever is the shortest.
- *ICT Management* ensures, in collaboration with the *Archivist* that this ICT material is stored in the archive in appropriate conditions.
- *ICT Management* ensures that the information in the *Inventory Database* is updated accordingly.

10. Destruction

- When ICT material may be destroyed, *ICT Management* ensures that an appropriate destruction method is used that ensures that the ICT material cannot be recovered.
- *ICT Management* ensures that the person who destroyed the ICT material signs an Equipment Decommissioning Certificate to certify that the material was appropriately destroyed.
- *ICT Management* ensures that the information in the *Inventory Database* is updated accordingly.
