ICT Security

Document version :	1.00
Implementation date :	31 Oct.2016
Document ref. :	SOP_ICT-005_ICT-Security_v1.00_dd.21_Oct.2016

I. PURPOSE

This Standard Operating Procedure (SOP) describes how ICT security is managed in Quipment.

II. SCOPE

This SOP is applicable to all ICT security management in Quipment SAS and in Quipment INC.

III. RESPONSIBILITIES

The responsibilities, mentioned in *italics*, are defined in the Functional Matrix as a role. The Functional Matrix indicates which persons are entitled to take on this responsibility.

IV. DEFINITIONS

All terms and abbreviations, used in this document, that may need clarification, are explained in a central document: "Quipment's Glossary of Terms and Abbreviations".

VI. PROCEDURE

1. Identify Security Type

- In ICT Security, 2 types of security can be distinguished:
  - Physical security (step 2), and
  - Logical security (step 5).
- Physical security is the protection of personnel, hardware, software, networks and data from physical actions and events that could cause serious loss or damage to Quipment and/or Quipment's clients. This includes protection from fire, flood, natural disasters, burglary, theft, vandalism and terrorism.
- Logical security consists of software safeguards for Quipment's systems, including user identification and password access, authenticating, access rights and authority levels. These measures are to ensure that only authorized users are able to perform actions or access information in the Quipment network or servers.

2. Physical Security: Location

- Depending on the location of the premises where the ICT systems are located, Quipment uses a different approach. Mainly, the distinction can be made between:
  - Quipment premises (step 3), and
  - Hosting Center (step 4).

3. Quipment Physical Access Management

- Physical access management to Quipment premises is described in SOP ADM-001 "Facility Management". The measures that are described in that SOP handle physical access management, visitors, fire alarms and protection, etc. These measures limit and control the access to the Quipment premises.
- The access to the Internal Quipment server is limited to authorized ICT personnel as the server is located in a lockable rack. Only *ICT Management,* the *ICT Security Officer* and Quipment *General Management* have a key of the rack.
- The physical access to the laptop PCs of Quipment personnel is each user's responsibility. Each person has to take good care of their PC and is personally responsible for loss or theft in case this is caused by willful misconduct or gross negligence. In case of loss or theft, the *ICT Security Officer* must be informed at once in order to allow the *ICT Security Officer* to take appropriate measures to contain possible damage and prevent intrusion attempts. The user must declare all cases of theft to the police as soon as possible.

4. Hosting Center: Ensure Access Management Agreements

- Several key ICT systems of Quipment are located in specialized data hosting centers. Quipment has specific contracts and/or Service Level Agreements (SLA) that warrant that access to these servers is limited and access strictly controlled. Quipment only contracts with high class and reputed data hosting centers that have a proven track record of managing access according to the strictest industry standards.

- In the agreements with the hosting centers, Quipment ensures that the hosting centers inform Quipment of all physical intrusions and intrusion attempts and possible impact on the Quipment servers or stored data.
- Whenever Quipment considers that there might be a doubt on the hosting center's access management, the *ICT Security Officer* can request that an audit is scheduled as per SOP QA-001 "Management Review".

5. Management of Logical Access

- Quipment foresees logical access safeguards for Quipment's ICT systems. These logical access safeguards are based on:
  - including user identification and password access, authenticating, access rights and authority levels (step 6), and
  - intrusion protection management (step 7 & 8).

6. User Logical Access Management

- User access to ICT systems is based on a need-to-know system.
- Based on the roles assigned in the Functional Matrix it is defined who needs to have access to what information.
- Based on the Functional Matrix, the *ICT Security Officer* configures the access rights of each person.
- Each collaborator receives a login and a personal password from the *ICT Security Officer* for PC access and server access. Neither the password nor the login can be changed by the collaborator.
- The *ICT Security Officer* has administrator's access to all software applications and servers. Whenever a user does not remember his/her password anymore, the *ICT Security Officer* can reset the access rights and assign a new login and password.
- User-passwords:
  - are at least 7 characters long,
  - include at least two uppercase letters and lowercase letters,
  - are a mix of letters and numbers.
- Passwords are never easy to guess, such as:
  - a person's name,
  - a birthdate or other recognizable date,
  - a license plate, or
  - other simple characteristic of the person or the person's entourage.
- Users are not allowed to share login or passwords with any other person.
- Users are not allowed to download any application without approval of the *ICT Security Officer*.
- Before data from a USB stick or other external data media are copied onto a PC, the user must run a virus detection check on these media.
- All cases of virus detection or other malware shall be reported at once to the *ICT Security Officer*.

7. Intrusion Protection Management

- Protection against intrusion, viruses, adware, spyware, malware, phishing, ... is adapted based on the importance of the system and the direct contact with internet. The following systems are foreseen:

  7.a. The IT PCs that are managing and monitoring the ICT system are protected with an Anti-Virus system and the data on the PC are encrypted.

  7.b. The user's PCs are protected with an Anti-Virus system. Furthermore, no important data may be stored on the user's PC but shall be filed on the dedicated servers.

  7.c. The access to the Internal Server at Quipment SAS is protected through a firewall.

  7.d. The WiFi access for collaborators in the offices is protected through an access code,

  7.e. There is a separated WiFi access in the offices for guests that does not have a login-controlled access. However this WiFi access only links directly to the internet and does not give any access to the Quipment servers.

- The *ICT Security Officer* is responsible for monitoring the effectiveness of these access protection tools and take remedial action whenever needed.

8. Server Access Management through IP's & VPN

- Access to the different servers is protected based on specific IP addresses and dedicated Virtual Private Network (VPN) channels.

  8.a. The access to the ERP server at site (1) is protected by a VPN or locked with a specific IP address. Only access with a login and password is authorized. The connection is also encrypted.

  8.b. The access to the QuipInvent server at site (1) is protected by a login and password and an encrypted connection.

  8.c. The access to the Quipment Utility server is protected by a VPN or locked with a specific IP address. Only access with a login and password is authorized. The connection is also encrypted.

  8.d. The access to the EScribe server is protected by a VPN for synchronization and locked with a specific IP address. Only access with a login and password is authorized. The connection is also encrypted.

  8.e. The access to the Quipment website on the mutualized server is open from the internet; the Quipment clients receive a login and password to access the QuipSite user-interface. However, further access from the QuipSite mutualized server to the ERP Server is protected by a VPN channel.

- The *ICT Security Officer* is responsible for monitoring the effectiveness of these access protection tools and take remedial action whenever needed.
- In the agreements with the hosting centers, Quipment ensures that the hosting centers inform Quipment of all logical intrusions and intrusion attempts and possible impact on the Quipment servers or stored data.
